

## RELIABILITY... SECURITY... AFFORDABILITY...

FROM ADEQUATE CAPACITY  
AND FUEL DIVERSITY

Because of federal regulations up to **85 Gigawatts** of **generation capacity** are projected to be **lost** by 2023, potentially jeopardizing reliability across the nation.

**Co-ops keep electricity flowing** when demand surges, thanks to diverse power supply and adequate capacity.

During the **polar vortex**, co-ops and many other utilities produced **record amounts of electricity** just to keep lights on and houses warm.

If new regulations force more generation to be shut down, where will YOU get your power from **in the future?**

**We can't afford new regulations that hurt  
the reliability of America's power supply.**
