

Costs are rising everywhere ...

... but your local electric cooperative is doing something about it. By investing in new technologies, we are improving efficiency and boosting reliability to help reduce your costs.

As part of your electric cooperative, you're also part of the solution. You can help by adding your own technology. Install a programmable thermostat to control your home's temperature both night and day. And, based on the season, adjust the thermostat a degree or two up or down for even more savings.
